1 Sudoku Solver

Here is all the constraints to solve a Sudoku.

1.1 Sudoku of size 9x9 & 4x4 :

- Set all the possible values for a case (1 to N)
- Must be different values in a row of the matrix (Sudoku)
- Must be different values in a column of the matrix (Sudoku)
- Must be different values in all sub-matrix
- Make sure that the specific constraints are included

1.2 Sudoku of size 16x16 & 25x25

- Same constraints that the Sudoku of size ≤ 9
- The new literals written in the .cnf file must have all the same length for i, j, and k to avoid confusion.

2 Sudoku has More Than One Solution

To verify if a Sudoku puzzle has more than one solution, the process involves excluding the current solution from the Sudoku in CNF (Conjunctive Normal Form). Subsequently, additional constraints are created, and a new instance of the Sudoku is solved. If this proves to be impossible, the Sudoku possesses a unique solution. Conversely, if a solution is found, it indicates that the Sudoku has more than one possible solution.

$$\bigwedge_{i=1}^N \bigwedge_{j=1}^N (\text{sudoku}[i-1][j-1] > 0 \rightarrow \neg \text{newlit}(i, j, \text{sudoku}[i-1][j-1]))$$

3 Creation of Sudoku

3.1 Normal creation

The process is straightforward. Initially, I select one of the Sudokus from the folder¹, and then, I iterate through the Sudoku, occasionally removing a single cell. The program ensures that deleting each cell maintains the uniqueness of the Sudoku.

3.2 Sudokus with only <size> minus 1 numbers

The operation is identical to normal creation. However, the distinction lies in the program's initial removal of all cells where the value is equal to N before applying the standard creation algorithm.

1. random one

4 A Personal Touch (Probabilistic Element)

4.1 Creation Difficulty

- I've incorporated a probabilistic element into the program. Users can opt ² for a difficulty level, choosing from "*easy*", "*medium*", or "*hard*" using the following syntax :

python sudokub.py -c <size> <difficulty>

or

python sudokub.py -cm <size> <difficulty>

- If you increase the difficulty, the number of empty cells will increase, making the Sudoku more challenging to solve.
- Difficulty Levels :
 - Easy removes a maximum of 50% of the cells.
 - Medium removes a maximum of 75% of the cells.
 - Hard removes a maximum of 90% of the cells.

2. By default set to medium level
